What this guide is, and what it is not

This is an educational guide to keeping a private, permitted record of your own work. It is not legal advice. It cannot interpret your specific employment agreement, your non-disclosure obligations, your employer's policies, or the laws that apply where you work. Where a question of permission is unclear, treat that as a signal to leave the information out and to ask someone qualified, such as your manager, your human resources team, or an attorney.

Written and designed by Temidayo Afonja, Founder, The Density Group. temidayoafonja.com

Welcome

If you are reading this after a hard change, or in the middle of one, start here. What you built did not disappear when your circumstances changed. When an offer I had accepted was rescinded, I learned that circumstances can change faster than experience does. This guide will help you see what you built again, clearly enough that someone else can see it too.

Most people do excellent work and remember almost none of it clearly.

The work was constant. You solved the problem, absorbed the lesson, and moved to the next thing before the last one had a name. Months later a review, a promotion case, or a sudden change asks you to account for a year, and you find yourself reaching for details that have already gone soft.

Across my career I have worked in and around talent, workforce, and organizational decisions: conversations about performance, promotion, restructuring, and readiness. One pattern kept surfacing, and it was simpler than the politics of any single room. Capable people would reach an important career moment and then have to reconstruct the work

that had brought them to it. Some could describe their contribution clearly. Others knew they had done meaningful work but no longer had the details.

Whether you can describe your work does not decide who gets promoted, hired, or selected. Sponsorship, opportunity, timing, business conditions, and plenty of things outside any one person's control shape those outcomes. What an accurate record does affect is narrower and still worth a great deal: how clearly your work can be understood when a decision depends on it. That part is learnable, and it is mostly a matter of keeping a record while the facts are still available to you.

Keep the Proof is that record and the discipline around it. It will not tell you what your career means or what move to make. It will help you hold on to the truth of your own work, in language a stranger can understand, kept in a way that respects the people you work for. That is a smaller promise than most career products make. It is also one you can keep.

Temidayo Afonja, Founder, The Density Group

Why you might be here

You did not come to this guide for a definition. You came because something is happening, or is about to.

Maybe a review is coming and you cannot cleanly recall the year. Maybe you were promoted in responsibility but not in title, and you are doing work no one has written down. Maybe your access just closed, and the record of what you did is now behind a door you cannot open. Maybe you have been in one place for fifteen years and you are not sure your work would read to anyone outside it. Maybe you are going back after a break. Maybe you were acquired, and new owners are asking who you are.

Underneath all of them is the same quiet thought: I know I did good work, and now I cannot quite lay my hands on the details. You are not trying to build a case yet, or impress anyone. You just want the truth of what you did, and the judgment and the decisions inside it, to still be there when you reach for it.

These are different circumstances. They share one first job.

Different circumstances. Same first job: build an accurate account of the work.

Before you can decide anything, translate anything for anyone, or make any case, you need a truthful record of what you did. That record is what this guide builds. Everything else,

including what your work means and where it could go, is a later question and, in some cases, a different tool. This one starts with the truth of the work itself.

Two ways in

CAPTURING NOW?

Start here

You still have your access, your systems, and your memory of recent work. You are in the best possible position, because you can capture the record while the facts are fresh. Begin with Your First 60 Minutes, then let the habit carry it forward.

ALREADY LOST ACCESS?

Start here

The change has already happened, and the record you wish you had does not exist yet. You have not failed, and you did not buy the wrong guide. You simply start differently, by rebuilding from what is still yours. Turn to Part Seven, Reconstruct.

There are two ways into this system, and they are equally valid. Choose the one that matches where you are standing right now.

How to use this guide, and the one rule

This guide has three jobs. It helps you capture what happened, clarify what was yours, and carry it forward in language an outsider can follow. Those three words, Capture, Clarify, Carry, are the whole shape of the system, and the next pages give you each one in turn.

You can read straight through in an unhurried sitting, or jump to the part you need. Wherever a tool appears, a completed example appears with it, so you are never looking at an empty box wondering what belongs there. Permission and protection run through the entire guide rather than sitting in one block, because they apply to every entry you make.

The one rule that never bends

You record your own recollection and information you are permitted to retain. You never copy, forward, or reconstruct material your employer owns. If permission is unclear, you leave it out. Everything else in this guide sits underneath that rule.

Before You Rebuild Anything

See what you already built

When work changes suddenly, the first thing to go is often the way you describe yourself. People with years of good work behind them start saying they are starting over, starting from scratch, going back to zero.

Those words can feel true in a hard week. They are rarely accurate, and they shape what you let yourself try.

I know this from my own life. When an offer I had accepted was rescinded before I could start, my plans disappeared faster than my experience did. What I had built was still there. I needed a way to see it again.

What the hard week tells you

A sudden change brings its own voice with it. Maybe I was never as good as I thought. Maybe nobody will see what I did. Maybe I have to prove everything again from nothing.

You do not need to argue with that voice. You only need to answer it with evidence. Every one of those sentences can be checked against your own record, and this guide will help you check it.

Start with three moments

Before you open Part One, write down three moments from the last few years when someone relied on your judgment. Keep each to one sentence: what the situation was, and what you did. You do not need numbers yet. You only need to notice what is already there.

Words to Stand On

Read these slowly, out loud if you can, before each session with your record. Every line is true for you today, and the rest of this guide helps you prove it.

I have done work that mattered, and I can name it.

What I built did not leave when the job did.

I can be experienced and new at the same time.

I can learn what the next place requires.

I will tell the truth about my work, without shrinking it and without inflating it.

I can carry hope and uncertainty in the same week.

One thing I did that someone relied on: _____

Why these words work

Encouragement fades when the week gets hard. Statements you can check against your own record hold. Each time you add an entry to your Professional Record, you are giving these words more evidence to stand on.

If you catch yourself saying you are starting over, try a different sentence: I am starting from what I have built.

Then keep reading. The rest of this guide helps you prove it.

A note on confidentiality before you begin

Everything in this system is built on one rule: you record only your own recollection of your work and information you are permitted to keep. You will be asked, repeatedly, not to copy, forward, photograph, download, screenshot, or reconstruct anything your employer owns. That rule holds on any device, at any hour, in any format. It is the first thing this guide teaches and the last thing it will let you forget.

PART ONE

UNDERSTAND THE RECORD

*What a professional record is, and why it goes missing. Kept short,
because you already recognized yourself on the way in.*

The opening question

If your work access disappeared this afternoon, how much of the record of your work would disappear with it?

Picture the ordinary version of a bad day. Not a scandal, just a change. A reorganization removes your login by five o'clock. A role is eliminated with two weeks' notice. A system migration wipes three years of your sent mail. You are fine, professionally and otherwise. But the record of what you did now lives in systems you can no longer open.

What would you still have? For most capable people the honest answer is a current title, a rough sense of their projects, and a handful of numbers they are not quite sure of. The specific decisions, the problems they caught before anyone noticed, the exact shape of the thing they built, all of it sat inside the work, and the work is behind a door that just closed.

This guide is built for the stretch of time between two sentences. The first is I am doing the work. The second is I suddenly need to explain what the work amounted to. That gap is usually months or years long, and almost nobody uses it. Keep the Proof is how you use it.

Why a professional record goes missing

It is tempting to blame memory. Memory plays a part. The larger reasons a professional record disappears are structural, and once you see them you can design around them.

It lives in systems you do not own. Your accomplishments are recorded, but not by you and not for you. They sit in a ticketing system, a shared drive, a customer platform, an email account, a chat history. Every one of those belongs to your employer. Access to them is a condition of your role, and it ends when the role does.

It is written in a private language. Inside a company, work is described in shorthand: project code names, internal acronyms, team rituals. That shorthand is efficient at work and meaningless everywhere else. A record written only in internal language is a record only your current employer can read.

The best parts are the least visible. The work that most deserves to be remembered often leaves the faintest trace. A judgment call that prevented a bad outcome produces no artifact, because the bad outcome never happened. Coordination across three teams

shows up in no single person's numbers. The quieter and more valuable the contribution, the more likely it is to vanish without a deliberate record.

It decays quietly. Details do not leave all at once. They fade. The figure you were sure of becomes approximate. The reason behind a decision blurs into the decision itself. Six months on, you can still tell the story, but you can no longer defend the specifics, and specifics are what a review or a resume runs on.

What a professional record is

A professional record is a truthful, private, retrievable account of what you contributed, what judgment you exercised, what changed because of your work, and what permitted information supports it. That is the whole definition, and each word in it is doing work.

A professional record is a record of your contribution and judgment. It covers what you did, beyond what you were assigned. It is written in language an outsider can follow. It is honest about your part in a shared result. It is built only from what you may keep. And it serves many career moments, long before any single one arrives.

This is disciplined recordkeeping. The aim is to make it accurate and findable, so that when a moment arrives that depends on the details, the details are there and you can trust them. Done well, an accurate account is more persuasive than an inflated one, because it holds up when someone asks a second question.

A note on the word most people reach for. Some people call this a brag document. That name is understandable, and this guide is not at war with it. What you are building is closer to evidence than to bragging, and the difference is practical: it gives someone else something concrete to consider. Use whatever word helps you start. The discipline is the same.

What is worth capturing

You cannot record everything, and you should not try. Activity is not contribution. Answering forty emails is activity. Deciding which of the forty needed a decision, and getting that one right, is contribution. The filter below keeps the record small and worth keeping.

Capture it if one of these is true.

- You exercised judgment, made a decision, or chose between real options.

- Something changed, improved, or became possible because of what you did.
- You prevented a problem, a cost, a delay, or a risk that would otherwise have landed.
- You handled scope, scale, or complexity that a description of your title would not reveal.
- You coordinated, influenced, or unblocked work across people or functions.
- You received specific feedback, recognition, or a result you can point to.

Let it go if it is only this.

- Routine execution of your basic duties with nothing distinctive about how you did it.
- Attendance, hours, or effort with no observable change attached.
- A task you were assigned but did not meaningfully shape.

A simple test. Before you record something, ask: if I described this to a thoughtful stranger, would they understand what I contributed and why it mattered? If the honest answer is no, either find the contribution underneath the activity, or leave it out.

The boundary: your account versus employer-owned artifacts

This is the distinction the whole system depends on, so it is worth stating plainly. Your professional record is your own account of your work. An employer-owned artifact is the material itself: the deck, the model, the code, the client file, the report. The practical habit is simple: keep your own high-level account of what you did, and do not copy employer-owned artifacts into your personal record.

Keep your own high-level account, your own sentence about what you did: "I rebuilt the onboarding process and cut new-hire ramp time," or "I found and closed a gap in how we granted system access," or "I led the vendor selection and negotiated better terms." Do not copy the underlying artifacts into your personal record: the onboarding deck, the HR system export, the employee list, the access logs, the security configuration, the audit tooling, the signed contract, the pricing sheet, or the internal cost model.

Notice what the accounts have in common. Each is a sentence you could say out loud in a hallway without exposing anything your employer owns. The artifacts are the underlying material, and none of it belongs in a personal record, no matter how convenient it would be to keep.

The line you will learn to hear. If the thing you want to save is a file, a screenshot, an export, or a copy of anything produced at work, it is an artifact, and it stays behind. If it is your own sentence about what you did, it is your account, and that is what you record.

One honest caveat. This distinction is usually clear, and it is meant as a practical habit, not a legal ruling. What you may keep can be unsettled in some situations, such as contract work, work made for hire, or specific terms you agreed to. Those are legal questions, not writing questions. Where what you may keep is unclear, the one rule governs: leave it out, and ask someone qualified.

Claim, example, evidence, corroboration

It helps to be precise about what a record can be, because the word "proof" means different things to different readers. There are four levels, and most honest professional accounts live at the second one.

A claim is a label you apply to yourself: "I am strategic." Anyone can write it, and on its own it carries almost nothing, because there is nothing underneath it to consider.

An example is a specific account: "Here is the situation, and the decision I made, and why." This is what a good record mostly produces, and it is far stronger than a claim. In a structured interview, which is one of the most reliable ways employers assess people, a specific example is exactly what earns weight.

Evidence is what supports the account: "Here is the documented result." Evidence is valuable where it exists, but it is often owned by your employer and frequently unavailable after you leave. This guide never asks you to take it.

Corroboration is another legitimate person or source supporting what happened: a former colleague who observed the work, or a public artifact that shows it. Corroboration can strengthen credibility, particularly in senior hiring. It is not something you manufacture, and it does not decide any employer's choice for them.

What this means for your record. Most of what you build here will be strong examples, sometimes supported by permitted evidence, sometimes prepared for corroboration. That is honest and it is enough. This guide will not imply that every entry contains documentary proof, and it will never invent a number to make invisible work look measurable. An accurate example holds up. A dressed-up claim does not.

The spine: Capture, Clarify, Carry

Every entry you make, from a two-minute note to a full record, moves through three stages. You will not think about them consciously for long. They become the shape of how you handle a piece of work worth keeping.

Capture is speed and honesty about events. You catch the work before the details soften, even when the note is rough. What happened?

Clarify is the heart of the system, and the part most records skip. You separate the team's result from your own part, name the judgment inside the task, and describe what changed. This is where a forgettable note becomes a real record. What was yours?

Carry is reach and safety. You put the record in words an outsider can follow, keep only what you are permitted to hold, and tag it so you can find it when a moment arrives. What can you responsibly take forward?

Two threads run through all three stages rather than sitting in one place. The first is permission: at every stage you keep only what you are allowed to keep. The second is retrieval: you tag entries as you go, so the record is searchable when it matters. The order of the three stages holds, though. Capture before you clarify, because a rough note beats a perfect memory you never wrote down. Clarify before you carry, because you cannot translate a contribution you have not yet separated from the team's.

YOUR FIRST 60 MINUTES

A focused first session. With focused time it takes about an hour, and you can also work through it across several shorter sittings. Each step stands on its own, so you can stop after any step and pick up where you left off. It gets you started with momentum and something real already in place, and the rest of the system builds from there.

The focused first session (capturing now)

Follow this in order. At the end you will have a working start, which is exactly the goal. The record grows from there.

- First few minutes. Read the one rule again, and the three tiers of permission on the Keep, Care, Never page. Choose a private home you control and turn on a password and multifactor authentication. Permission comes before storage, always. **GOOD PLACE TO PAUSE**
- Next stretch. Sweep your own memory and permitted sources for the last few months. No employer files. Just what you can recall and what is already public: projects, decisions, moments that mattered. If it helps, run down the list of capture events on the next page and mark the ones that happened.
- The middle of the session. Write at least three Quick Captures from that sweep. Rough is fine. Speed beats polish. **GOOD PLACE TO PAUSE**
- Then. Expand your strongest capture into a Full Entry. Fill only the fields that apply. Somewhere in it, name the judgment or the decision or the problem you prevented. **GOOD PLACE TO PAUSE**
- Near the end. Translate that entry into one portable Proof Line.
- Before you finish, name one person who could confirm the work, by role, and note what they directly observed.
- Last few minutes. Set one clear reminder for your next capture, so the record keeps going. An upcoming event or a recurring date both work.

What you have at the end of the session.

- Three or more pieces of work captured.

- One contribution clarified in depth.
- One judgment, decision, or prevention example identified.
- One portable Proof Line written.
- One possible corroborator identified.
- One personally controlled record location established.
- One clear trigger for the next capture.

That is a working start. Everything after it is lighter than this.

The focused first session (already lost access)

If your access is already gone, run the session through reconstruction instead. The finish line is the same. Only the starting material is different, and nothing here treats you as behind.

- First few minutes. Read the one rule and the three tiers. Choose a private home you control and secure it. The permission rule does not relax because the timing is inconvenient; it protects you either way. **GOOD PLACE TO PAUSE**
- Next stretch. Gather what is still yours to use: your own memory, previous resume versions, your public professional profile, documents you already hold, old job descriptions, certifications, and anything already public about the work. Part Seven lists these in full. Do not reach for anything behind a closed door.
- The middle of the session. Pick one role or one year you remember well. Write three Quick Captures from memory, anchored to moments you recall clearly: a hard call, a launch, a problem you caught, a piece of feedback. **GOOD PLACE TO PAUSE**
- Then. Expand the strongest into a Full Entry. Mark anything you are unsure of as unsure. An honest approximate record is worth far more than a confident wrong one. **GOOD PLACE TO PAUSE**
- Near the end. Translate one entry into a portable Proof Line, and name one former colleague who could confirm the work and what they directly observed.
- Last few minutes. Set the trigger to start capturing in real time from now on, so you never have to reconstruct again.

You will finish with the same seven outcomes as the capture route. You started from cold material, and you still built something true.

PART TWO

CAPTURE

What happened? The goal of this stage is speed: make sure the raw material still exists before anything else is done with it. Clarifying and carrying come later.

The Two-Minute Quick Capture

The Quick Capture exists for one reason: to catch the work before it fades, in the two minutes after it happens. It is deliberately small. Five short prompts, no perfect wording required. You are not writing the final version. You are making sure the final version is still possible later.

The five prompts.

- What happened? The event or piece of work, in a line.
- What was my specific contribution or judgment? Your part, not the team's.
- What changed, improved, became possible, or was prevented? The consequence.
- Who could confirm this, or what public source supports it? For a person, note their role and what they directly observed. Do not store private contact information. Any use of a public source stays subject to the permission rules.
- Confidential detail to keep out. Name it, so you remember to leave it out.

COMPLETED QUICK CAPTURE. DEVIN A., DISTRIBUTION CENTER SUPERVISOR, OPERATIONS, CAPTURED THE SAME AFTERNOON.

What happened: Recurring mispicks on the night shift were driving returns. I changed the pick-verification step and the error rate dropped. **My specific contribution:** I noticed the errors clustered on one workflow, proposed a second scan at pack-out, and ran the two-week trial that proved it out. **What changed:** Shipping errors on that line fell sharply and stayed down after the change was made permanent. **Who could confirm this:** My operations manager, who approved the rollout and saw the error rate fall. The improvement was later cited in a team update. **Must stay out:** The internal error dashboards, customer order data, and the returns figures themselves. I keep my own account, not the reports.

Notice what the capture does and does not hold. It holds Devin's account and a person who could confirm it. It does not hold a single employer file. That is the pattern for every capture you make.

The moments worth catching

A record does not fail because people lack discipline. It fails because nothing reminds them to open it. The fix is to tie capture to events rather than only to dates. When one of these happens, take two minutes and write a Quick Capture. Most of them take less time than the meeting that prompted them.

- A project or initiative ended.
- Your scope or responsibility changed.
- You received praise, feedback, or recognition.
- A problem was escalated to you, or by you.
- You caught or prevented a risk.
- Your manager or leadership changed.
- You inherited difficult or unfamiliar work.
- You made a decision under real uncertainty.
- A measurable result appeared.
- Your team changed around you.
- You started doing work above your title.

You do not need all eleven. You need the habit of noticing that one just happened. Recognizing the moment is most of the work; the two minutes of writing is the easy part.

The Full Professional Record Entry

When a piece of work matters enough to keep properly, you expand a Quick Capture into a full entry. A full entry has room for everything that makes a contribution legible later. You will not fill every field every time, and you should not try. A strong entry with six good fields beats a padded one with sixteen.

The fields are grouped so a full entry is quick to complete and easy to reread later. The groups are the shape of a good account: when and what, what was yours, the judgment inside it, what changed and what supports it, and how you would say it and who could confirm it.

When and what. Date or period. Project or work event. Situation or need. Why it mattered.

What was yours. Formal responsibility, what you were assigned on paper. Actual ownership, what you truly drove, which is often different. Scope and constraint, the scale, complexity, or limits you worked within. People and functions involved, by role.

The judgment inside it. Decision or judgment exercised, the call you made and the options you weighed. Actions taken.

What changed, and what supports it. Outcome or observable change. Problem prevented. Quantitative evidence, only when accurate and permitted. Qualitative evidence or validation. Team result versus your honest part.

How you would say it, and who could confirm it. Internal wording, before translation. Portable-language version. Who could corroborate this, by role, and what they directly observed. Permitted evidence reference; name the source or location, do not paste the artifact or confidential content. Confidentiality and permission check. Retrieval tags: review, promotion, compensation, resume, interview, biography, transition.

COMPLETED FULL ENTRY. MAYA O., ONBOARDING PROGRAM LEAD, PEOPLE AND HR, MEASURABLE AND QUALITATIVE.

Period: Second and third quarters of last year. **Project:** Redesign of the new-hire onboarding program for a growing operations team. **Situation:** New hires were taking a long time to become productive, and early attrition was high. The existing program was a slide deck and a checklist. Formal responsibility versus actual ownership: On paper I coordinated onboarding logistics. In practice I redesigned the program end to end: the sequence, the first-week plan, the manager's role, and the thirty-day check-in. **Decision or judgment:** I chose to move the program from information delivery to a structured first month with clear milestones, over the easier option of simply updating the deck. **Outcome or change:** New hires reached full productivity noticeably sooner, and early departures dropped. Managers began asking to use the model for their own teams. **Evidence:** Time to full productivity improved by a figure I recorded accurately at the time. Two department heads asked to adopt the approach, which I noted as it happened. **Who could corroborate:** The operations manager I partnered with, who saw the redesign and the results directly. **Confidentiality check:** I keep my own account and the fact of the improvement. I do not keep the HR system data, the employee records, or the internal reports the numbers came from. **Retrieval tags:** Promotion, performance review, resume, biography.

Capturing well

Four things separate a memorable entry from a forgettable one. Most records capture the first and skip the rest. This page belongs to Capture, but it is already reaching toward Clarify, which is the next and most important stage.

Assigned responsibility is only the starting point. Your job description tells a reader what you were supposed to do. It rarely tells them what you did. The gap between the two is where most of your real contribution lives. Record the assignment, then record what you drove beyond it.

Judgment is the part with no artifact. Anyone can list actions. Fewer people can name the decision underneath the actions: the option they chose and the ones they set aside. That choice is often the most valuable thing you did, and it leaves no trace unless you write it down. Capture the call, not only the task.

Scope makes size legible. A title hides scale. "Managed the rollout" could mean two people or two hundred, one region or twelve. Without inventing precision you do not have, note the scope you worked within: how many, how large, how complex, under what constraint.

Push past the action to the observable change. The weakest entries end with what you did. The strongest end with what became different because you did it. Push every entry one step past the action to the observable change, even when the change is modest.

PART THREE

PERMISSION AND PROTECTION

The most valuable thing this guide does is tell you what not to keep. You met the one rule on the way in, and you will meet it again at every stage. This part is where you learn the full standard, once, in depth. Permission comes before protection, and it comes before everything else.

The central rule

Permission comes before protection. A secure personal device does not make information yours to retain.

This is the sentence to remember above all others. People reach for the wrong test constantly. They ask whether the information is stored safely, whether they used their own laptop, whether it happened after hours. None of those questions is the right one. The right question is whether you are permitted to keep the information at all. Security is what you do after you have established permission. It is never a substitute for it.

What does not create permission.

- Using a personal device, a personal account, or your own phone. Ownership of the hardware does not transfer ownership of the information.
- Working outside office hours. Confidentiality obligations do not clock out at six.
- Generalizing, rounding, anonymizing, or otherwise sanitizing something. Softening the wording does not make restricted information yours.
- Believing the information is harmless, or that no one would mind. Permission is a fact about your agreements, not a guess about intentions.

The permission test. Before anything enters your record, ask one question: am I permitted to retain this outside my employer's systems? If yes, keep your own high-level account of it. If no, or if you are not sure, leave it out and, where it matters, ask someone qualified. For this record, treat any uncertainty as a reason to stop and leave the information out.

Keep, Care, Never

KEEP Your own high-level recollection: what you did, decisions you made, problems you helped prevent, publicly disclosed outcomes, and anything your employer has expressly permitted you to retain.

CARE Numbers, client or project detail, and internal context that may be sensitive. Seek permission, use only what is already public, or leave it out. When unsure, treat it as the next tier.

NEVER Source code, credentials, security settings, customer or employee data, unreleased product detail, internal financials, privileged or legal material, trade secrets, and any file your employer owns. Never copy, forward, screenshot, download, or reconstruct these anywhere.

Default downward. Between Keep and Care, treat as Care. Between Care and Never, treat as Never.

Sort everything you might record into three tiers. With practice this becomes instant.

Generalizing information does not create permission. Use generalized wording only after you have confirmed that you are permitted to retain the underlying information. Softening the words changes how something reads, not whether you are permitted to keep it.

The habit is to default downward. When something sits between Keep and Care, treat it as Care. When it sits between Care and Never, treat it as Never. You may lose some detail this way, but you will keep the record accurate and defensible.

Lines that do not move

Some actions are outside the system entirely. They are not judgment calls and they are not softened by good intentions or careful storage.

- Do not forward, download, photograph, screenshot, print, upload, or copy employer-owned material into any personal system.
- Do not circumvent security controls, data-loss tools, access restrictions, monitoring, or retention rules to obtain something for your record.
- Do not retain source code, credentials, security configurations, customer or employee data, personal information, internal financials, privileged communications, unreleased

product detail, trade secrets, confidential research, proprietary models, internal decks, or client materials.

- Do not paste confidential or employer-owned work information into an AI system of any kind.
- When permission is uncertain, omit the information and seek qualified advice. That is the whole procedure.

What the record runs on. Your own high-level recollection of what you did, information that has been publicly disclosed, and anything your employer has expressly permitted you to retain. That is the entire supply. It is narrower than people expect, and it is enough.

Rebuilding the record: what you can safely use

The rules above are about what you may not take. There is a quieter question worth answering plainly, especially when you are rebuilding after a change: what can you safely use to rebuild the record?

This guide answers that as a matter of habit, not of law. It cannot tell you what rights you have where you work or live, because those depend on your own agreements and where you are, and they are questions for someone qualified rather than for a handbook. What it can give you is a safe default that holds regardless.

Start from what is plainly yours to use.

- Your own recollection of what you did. This is the largest source, and the one no one can close.
- Information that is already public. Published work, public announcements, and public artifacts are already in the open, so working from what is public keeps you on safe ground. Use the public version, not an internal copy of it.
- Documents you already personally hold. If you were given something and you still have your own copy, you have it. Whether you are free to reuse a particular document can depend on what you agreed to, so where that is unclear, treat it under the one rule rather than assuming.

Two habits keep you safe at the edges.

- When you want to use something that is not clearly yours, ask for permission in writing. A written yes is clearer and safer than an assumed or spoken one, and it protects both sides.

- When permission is unclear, leave the item out and ask someone qualified, such as a former manager, an HR contact, or an attorney. For this record, treat any uncertainty as a reason to leave the item out.

This default is deliberately narrower than the full set of options that may be open to you. Depending on where you are, more may be available, and a qualified person can tell you. Staying inside this default keeps you on safe ground while you rebuild, without turning a private recordkeeping habit into a legal question you have to settle alone.

Choosing and securing a home you control

Your record needs a home. The requirements are modest, and they come in a strict order: the content must be permitted first, and only then does the storage matter. Securing a record you were not allowed to keep does not fix the problem. It hides it.

Choose a home you control. Use a personally controlled account rather than an employer-owned account, drive, or device. The recommended home is your Professional Record, the copyable working document included with this guide, kept in a personal, widely readable format you control. Keep it in one place. A record scattered across four apps is a record you will not maintain.

Then secure it, in this order. Protect it with a unique password and turn on multifactor authentication. Prefer storage that is encrypted and access-controlled. Keep a backup only where the underlying content is permitted to live. Never store the record on a device or in an account your employer owns or can reclaim.

Order of operations. Permission, then storage. Every time. A locked box is only as safe as your right to hold what is inside it.

PART FOUR

CLARIFY

What was yours? This is the center of the system. Capture makes sure the raw material survives. Clarify is where a rough note becomes a real record: you separate your part from the team's, name the judgment no artifact shows, make invisible and preventive work legible, and give scope its true size. Most records skip this stage, which is exactly why most records are weak.

Separating a team result from your part

Most meaningful work is shared, and shared work creates a recording problem. Claim the whole result and you are exaggerating. Claim nothing and you disappear from your own record. The skill is to state the team's outcome accurately and then name your specific part within it, without inflating and without vanishing.

Two sentences, always in this order. First, the shared result: what the group achieved. Second, your contribution: the particular thing you drove inside it. "The team delivered the platform migration on schedule. My part was owning the data-integrity plan and making the call to phase the cutover, which kept us from a rushed switch." Both sentences are true. Neither one steals from the other.

A MANAGER SEPARATING THE TWO. GRACE W., ENGINEERING MANAGER, MANAGEMENT, TEAM OUTCOME AND HONEST INDIVIDUAL CONTRIBUTION.

The team result: My team of nine shipped a long-delayed platform migration, on time, with no major incidents. **My actual contribution:** I did not write the migration. My part was sequencing the work, protecting the team from mid-project scope changes, and deciding to run a phased cutover instead of a single switch. **The judgment inside it:** The phased approach was mine to argue for and mine to own. It is the reason a risky switch did not become a bad weekend. **Portable version:** Led a nine-person team through a complex platform migration, delivered on schedule with no major incidents, and set the phased rollout approach that protected reliability during the transition.

Capturing work with no clean metric

A great deal of valuable work produces no tidy number. Coordination, judgment, care, and prevention rarely come with a percentage attached. You can still record this work. Describe the change in credible, concrete terms, and never force a figure you do not have.

Describe the before and the after. When there is no metric, there is almost always a contrast. What was true before your work, and what was true after? "The handoff between the two teams kept failing; after I redesigned it, work stopped falling through the gap" is credible with no number in it, because a reader can picture both states.

Name the specific consequence. Vague improvement does not persuade. Specific improvement does. Compare "made things better" with "the weekly report that used to take

two people a full day now takes one person an hour." A concrete, honest particular is more persuasive than a round number you cannot defend.

Never invent the number. If you do not have an accurate figure, do not manufacture one. An invented metric is the fastest way to lose a reader's trust, because the first careful question exposes it. A well-described qualitative result is stronger than a fabricated quantitative one. Accuracy is the entire value of this record.

Problems prevented and invisible contributions

The most undervalued work in any organization is the problem that never happened. Prevention leaves no artifact by definition. The outage you caught before it spread, the error you flagged before it reached a customer, the misunderstanding you resolved before it became a conflict: none of these produce a result you can point to, because the point is that there was no result.

Record the risk, the catch, and the likely path. To capture prevention accurately, name three things: the risk that was forming, what you noticed or did, and the outcome that was on its way if no one had acted. "A misconfiguration would likely have exposed internal access; I caught it in review and it was corrected before anything was affected" is a complete account of the judgment, with nothing invented and nothing exposed.

Stay honest about certainty. Prevention invites overstatement, so hold the line. You do not know for certain what would have happened. Say "would likely have" rather than "definitely would have." The honest version is still strong, and it is the version that survives a follow-up question.

PREVENTION, CAPTURED WITH CARE. THEO R., SECURITY ANALYST, TECHNOLOGY AND CYBERSECURITY, NO CLEAN METRIC, PROBLEM PREVENTED.

The risk forming: During a routine review I found that a group of accounts had been granted more access than their roles required. **What I did:** I traced how the access had been assigned, flagged it, and worked with the owning team to correct it and to close the gap that had allowed it. **The path avoided:** Left in place, the excess access would likely have become a real exposure. It was corrected before it was used. **Kept versus left out:** I keep my account of the judgment and the fix. I keep no logs, no account names, no security configuration, and no internal tooling detail.

Scope you carried without the title

Some of the most common senior work is the hardest to record, because it never got a name. You absorbed a departed manager's responsibilities. You ran a function the org chart still lists under someone else. You made director-level calls with a manager's title. The work was real. The title did not move, and so nothing wrote it down.

Say the work in ordinary language first, before reaching for any label. Compare "expanded my span of control" with "when my manager left, I took over the team's planning, the budget conversations, and the two hardest client relationships, and no one backfilled the role for nine months." A reader understands that immediately.

Then give it its true size and name the judgment inside it. Scope is what makes uncredited work legible: how many people, how much budget, how many functions, over how long, and what you decided that a person at your titled level would not normally decide. You are not claiming a title you did not hold. You are recording, accurately, the scope you carried, so that it counts as what it was.

SCOPE WITHOUT THE TITLE. A SENIOR MANAGER ABSORBING DIRECTOR-LEVEL WORK.

The situation: A director left and the role sat open. I was asked to "keep things running."

Actual ownership: For nine months I owned the team's roadmap, ran the quarterly planning and budget discussions, and carried the two most difficult partner relationships, in addition to my own role. **Scope and constraint:** A team of eleven, a budget line I had not previously owned, and three cross-functional partners, with no change to my title or level. **The**

judgment: I decided which of the director's commitments to hold and which to renegotiate down, rather than trying to carry all of them and failing quietly. **Portable version:** Held

director-level responsibility for a team of eleven for nine months during an open role, owning the roadmap, planning, budget conversations, and the most difficult partner relationships, and deciding which commitments to protect under the constraint. **Kept versus left out:** My own account of the scope and the calls. Not the budget figures, the partner names, or any internal document.

Who could confirm this

Institutions tend to have short memories. Formal employment verification is often limited to basic details such as your title and your dates, while the people who worked closely with you may remember far more of the contribution itself. When you leave, that firsthand memory is often the part that lasts. So while the work is fresh, note who saw it.

For an entry worth keeping, add two small things: who could confirm this, by role, and what they directly observed. "The operations manager I partnered with, who saw the redesign and its results." That is all. You are recording that a witness exists and what they witnessed, so that later, if it is ever useful, you know who to prepare with specifics.

Keep this narrow, on purpose. This is corroboration readiness, and nothing more. It is not networking, not outreach scripting, not referral strategy, and not personal-brand building. Record the role and the observation. Do not store a colleague's private contact details or personal information inside your record.

What corroboration can and cannot do. Corroboration can strengthen credibility, particularly in senior hiring, where informal conversations often carry weight. It does not decide an employer's choice, and this guide will never suggest that it does. Its job is honest: to make sure that when your account matters, someone who saw the work is ready to confirm it.

PART FIVE

CARRY

What can you responsibly take forward? Capture kept the material, Clarify made it honest, and Carry makes it usable: said in words an outsider can follow, kept only where you are permitted to keep it, and ready for the moments that ask for it. Carry does one kind of translation, the general kind. It stops before deciding what your work means for a particular destination, which is a different job and a later page.

Translate: from internal language to portable language

A record only your current employer can read is a record that expires when you leave.

Translation is the skill of saying the same true thing in words an outsider can follow. It keeps the meaning and changes only the words, turning a private shorthand into a description that travels.

Most entries need one of eight moves. Name to function: "Ran Project Northwind" becomes "Led the customer-data migration." Assignment to contribution: "Responsible for reporting" becomes "Rebuilt the reporting so leaders could act on it." Activity to consequence: "Held weekly reviews" becomes "Caught risks early enough to prevent slippage." Team to your part: "We launched it" becomes "I owned the rollout plan for the launch." Acronym to meaning: "Cleared the KYC backlog" becomes "Cleared a backlog of customer identity checks." "Helped with" to real role: "Helped with the audit" becomes "Prepared the evidence and answered the auditors directly." No number to credible detail: "Improved the process" becomes "Cut a two-day task to a few hours." Number to scale: "Handled 40 accounts" becomes "Managed 40 enterprise accounts across three regions."

A ninth line is different, because it keeps you safe rather than clear. Sensitive to permitted: turn sensitive detail into a permitted, high-level description, and never use translation to smuggle restricted information out in disguise. If the only accurate version would expose something you may not keep, the correct move is to omit it, not to reword it.

What translation is. This is general translation: plain language an outsider can follow, with your scope and context kept attached. It is not a judgment about whether your experience fits a particular role, industry, or employer. Saying your work clearly does not, by itself, make it portable to a chosen destination, and being portable does not guarantee that a given employer will value it. Those are separate questions, and the last page of this part is where this guide hands them off.

Build: the Proof Line

A Proof Line is a single, plain-language sentence that carries the most useful parts of an entry in a form you can drop into a review, a resume, or a conversation. It is the portable end product of everything the record holds. You build it by combining, in whatever order reads well, up to five ingredients: the condition you were responding to, your part, the scope or

constraint, the outcome, and the support, meaning permitted evidence or validation when you have it.

Maya's Proof Line: "Redesigned new-hire onboarding for a growing operations team, cutting time to full productivity and reducing early attrition, with the model later adopted by two other departments."

A Proof Line does not need a number to be strong, and it must never contain an invented one. It also never claims sole credit for a shared result. If a line would only sound impressive by overstating your ownership, it is wrong, and you rewrite it until it is true.

A Proof Line is general on purpose. It is a true, reusable sentence you keep. When a specific job, employer, or application is in front of you, two later sections put it to use: Match Your Proof to a Role lines it up against what a role asks for, and Put Your Record to Work carries it into a resume line, a LinkedIn About section, an interview answer, and a promotion note.

See it work: before and after

Translation is easiest to learn by watching it happen. Each pair below keeps the same underlying truth. The weaker version is internal, vague, or overclaimed. The stronger version is portable, specific, and honest.

"Owned the Q3 OKR for the CS org" becomes "Set and delivered the quarter's top goal for the customer support team." "Helped migrate to the new platform" becomes "Owned the data-integrity plan for a platform migration and phased the cutover to protect reliability." "Improved team efficiency" becomes "Redesigned a weekly reporting task from two days to a few hours." "Single-handedly saved the launch" becomes "Made the call to delay one day to fix a data issue, which kept the launch from shipping broken." "Handled a security thing" becomes "Found and corrected an access gap in review before it could be exploited." "Did a lot of cross-functional work" becomes "Coordinated three teams to resolve a recurring handoff failure between them."

Read the stronger column again and notice what none of them do. None invents a number. None claims a whole team's work. None exposes a name, a system, or a file. They are simply the true thing, said well enough to travel.

Where the record becomes useful

Once your record is honest and portable, it earns its keep at the moments that ask for an account of your work: a performance review, a promotion case, an internal move, interview preparation, a career pivot, re-entry after a break, and unexpected change. Part Eight shows which entries to pull for each of these.

This guide gets you the raw material and stops there. It does not teach you how to interview, negotiate, write a resume, or decide which of these moves to make. Those are real skills and real decisions, and they are deliberately not this guide's job.

What would not travel: the edge of translation

There is one more question that belongs here in shape but not in scope. General translation makes your work readable to any outsider. It does not tell you what your experience means for a specific destination: which parts would carry to a particular role, industry, or level, which parts would not, and what you would need to relearn to be credible there.

That question is real and it matters. It is simply a different job, and answering it well needs a chosen destination and a different tool. When you reach it, note the question and carry your record forward to it, rather than trying to answer it inside these pages.

Keep the Proof builds the honest, portable record. The Capability Formation Field Kit and the Career Move Review read what that record means for a direction you are considering, what would travel, and what you would need to earn again. This guide's work is done when your record is true, portable, and safe to keep.

PART SIX

WORKED EXAMPLES

Different functions, different levels, one discipline. You have already seen Devin in operations, Maya in people and HR, Theo in security, Grace in engineering management, and a senior manager carrying director-level scope. A few more complete the set, chosen to cover the kinds of senior work that leave the weakest automatic trail. Each follows the same card format: the work, the judgment, what changed, the portable version, and what is kept versus left out.

A sensitive context, handled by omission

PRIYA N., SENIOR INTERNAL AUDITOR, FINANCE, AUDIT, AND RISK.

The work: I led an internal audit of a financial process and identified a control weakness that had gone unnoticed for some time. **The judgment:** I decided which findings were material enough to escalate and how to frame them so they would be acted on rather than argued with. **Why this one is delicate:** The subject matter is sensitive and specific to my employer. The correct record is my own high-level account, not the findings, the figures, or the systems involved. **Portable version:** Led an internal audit that surfaced a significant control weakness, and framed the findings so leadership acted on them. No confidential detail retained. **Kept versus left out:** Kept my role, my judgment, the fact of the outcome. Left out the specific process, the numbers, the named systems, and every working paper.

Value from coordination, not output

SAM B., CLINICAL RESEARCH COORDINATOR, HEALTHCARE AND RESEARCH.

The work: A study was stalling because three groups, clinical staff, data management, and an external partner, were working from different assumptions. **My actual contribution:** I had no formal authority over any of the three. My part was seeing why they were stuck, building a shared plan, and keeping it moving without a title that required them to listen. **The outcome:** The study got back on schedule. My name appears on no deliverable, because the contribution was the coordination itself. **Portable version:** Coordinated three functions with no formal authority to unblock a stalled research study and return it to schedule, working through influence rather than mandate.

A decision under uncertainty, with an outcome no one can cleanly claim

ANDRE M., OPERATIONS MANAGER, MANUFACTURING.

The work: A supplier looked likely to miss a critical delivery, and I had to decide whether to switch to a costlier backup before I could be sure the first would fail. **The judgment:** I chose to split the order, paying more to protect the timeline, on incomplete information, knowing I might be spending money I did not need to. **What changed:** The primary supplier did slip, and the split kept the line running. I record this as a judgment made under uncertainty. If the supplier had delivered, the same decision would have looked like an unnecessary cost.

Portable version: Made a time-critical sourcing call under uncertainty, splitting an order to protect a production timeline when a key supplier looked at risk, and accepted a known cost to avoid a larger one. **Kept versus left out:** My reasoning and the decision. Not the supplier, the contract, or the figures.

Developing a person, which leaves almost no trace

LENA K., TEAM LEAD, MARKETING.

The work: A capable analyst on my team was stalling and close to leaving. Over two quarters I changed how I gave them work and feedback, and moved them onto higher-stakes projects with support. **My contribution: The development was the work:** the coaching, the deliberate stretch assignments, the protection while they found their footing. **What changed:** They stayed, took on a role a level up within the year, and now lead work I used to do. There is no artifact for any of it. **Portable version:** Coached a stalling analyst over two quarters through restructured feedback and deliberate stretch work; they took on a higher-level role within the year, having been close to leaving before. **Kept versus left out:** My own account of what I did and what changed. Not the person's private performance details or any HR record.

Repairing a relationship between two functions

MARCUS D., PROGRAM MANAGER, TECHNOLOGY AND OPERATIONS.

The work: Two teams that had to work together had stopped trusting each other after a project went badly, and the dysfunction was slowing everything they shared. **My contribution:** I was not asked to fix the relationship; I decided it was the real blocker. I ran the difficult conversations, rebuilt a shared way of working, and stayed close until the habit held. **What changed:** The two teams began shipping shared work on time again. The repair itself is the contribution, and it shows up in no one's metrics. **Portable version:** Diagnosed a breakdown between two functions as the true cause of repeated delays, and rebuilt a working relationship between them, restoring reliable delivery of shared work. **Kept versus left out:** My account of the judgment and the work. Not names, not the internal history, not any private detail about the people involved.

Pre-break experience, assembled after time away

ROSA V., RETURNING AFTER A TWO-YEAR CAREGIVING BREAK.

The work: Before my break I had led a significant piece of work, and after two years away I needed to assemble it into a record I could stand behind, accurately dated. **My contribution:** I rebuilt the account from my own memory, my prior resume, and what was already public, and I marked clearly what I was sure of and what I was not. **What changed:** I re-entered with a clear, dated account of senior work rather than an apology for a gap. **Portable version:** Led a significant initiative before the break, then rebuilt and accurately dated the account of it after two years away, distinguishing what is verified from what is recalled. **Kept versus left out:** My own recollection and public information. Nothing from a former employer's systems. Recency is a real screen, and this record does not pretend the work is more current than it is.

One item, all the way through

Here is a single piece of work carried through the entire system: Quick Capture, to Full Entry, to Proof Line, to retrieval tag, using Theo's prevention work from earlier.

Quick Capture: Found over-broad access on a set of accounts during a routine review; traced how it happened, flagged it, and drove the fix and the process gap behind it; a likely exposure was prevented before the excess access could be used; the owning team's lead can confirm it; all logs, account names, tooling, and configuration stay out. **Full Entry, the fields that matter here:** assigned to routine access reviews, drove a correction and a process change; chose to treat a quiet finding as urgent and fix the cause, not just the instance; the excess access was removed and the process gap closed; no clean metric, credible qualitative outcome confirmed by the owning team. **Proof Line:** "During a routine access review, I found and corrected over-broad account access and closed the process gap behind it, preventing a likely exposure before the excess access could be used."
Retrieval tags: performance review, promotion, resume, interview.

PART SEVEN

RECONSTRUCT

Already lost access? Start here.

Perhaps you are reading this after a change, not before one. The record you wish you had does not exist, and the systems that held the details are closed. This is not a failure, and you did not miss your only chance. If the change has already happened, you can still rebuild a useful account. You simply start differently.

What reconstruction can and cannot recover

A reconstructed record will not be as complete as one captured in real time, and it should not pretend to be. What it can be is honest, useful, and enough to carry into the moment in front of you. The goal is to rebuild what you can stand behind, mark clearly what you cannot, and then start capturing forward so you never have to do this again.

The rule does not relax because the timing is inconvenient. Work only from what you are permitted to use: your own memory, information that is already public, and anything you already hold or were expressly permitted to keep. What is not usable is a copy of anything you took, or access you were not meant to retain.

Possible starting points for reconstruction

Even after access ends, more remains than people expect. Below are possible starting points, arranged from the safest to those that need more care. Work from the top down.

Start from your own recollection.

- Your own memory, anchored to moments you remember clearly.

Then draw on information that is already public.

- Previous public versions of your resume.
- Your public professional profile and its history.
- Public announcements, press releases, and annual reports that mention the work.
- Public work and artifacts already in the open.

Use other information only when you know you are permitted to use or retain it.

- Documents you already hold, such as offer letters, signed reviews, pay records, certificates, and old job descriptions.
- Certifications and training completions.

- Personal calendars, where appropriate.
- Former colleagues, for what they can confirm from their own memory.

Already possessing something does not, by itself, settle whether you may reuse or retain it for this purpose. Where a source is not clearly yours to use, the one rule governs: leave it out and ask someone qualified. The page "Rebuilding the record: what you can safely use" in Part Three gives the safe default in full. This guide does not attempt to resolve the specific rights that vary by employer or location.

Rebuilding accurately, and marking what you know

Work role by role, or year by year. Recall the major projects and decisions of each, anchor to the moments you remember most clearly, write Quick Captures from memory, and expand the strongest into full entries. Then start capturing in real time.

The honesty of a reconstructed record lives in how you mark each part of it. Label every entry, or every field, at one of four levels, so you never present a memory as a fact.

- Known. You are certain, and you could stand behind it under a direct question.
- Supported. Something you hold or that is public backs it up.
- Remembered but not verified. You recall it clearly, but you have nothing outside your memory to confirm it.
- Uncertain. You think it happened roughly this way, but you are not sure of the specifics.

An account marked this way is stronger than a confident one, not weaker, because it tells a careful reader exactly how much weight each part can bear. Reconstruction has a ceiling. Name it, work within it, and let the going-forward habit do the rest.

PART EIGHT

KEEP IT CURRENT, AND USE IT

An hour to set up, then very little. The record only earns its keep if maintaining it is nearly effortless, and if you can find the right entries fast when a moment arrives.

Keeping it current

There are two useful ways to keep the record current, and they work well together. The first is to capture when something worth keeping happens. The second is a light periodic sweep that catches what you missed and keeps the record clean. Neither is required on its own, and neither is universally better. Use whichever you will sustain, or both.

Event-based capture. When one of the moments from Part Two happens, a project ends, your scope changes, feedback arrives, a decision is made, a risk is prevented, you take two minutes and capture it. It suits work that announces itself.

A periodic sweep. A short monthly or quarterly pass catches the work that did not arrive as an obvious moment, and gives you a chance to clean and correct the record. It suits work that accumulates quietly. The two routines below are here for readers who want a rhythm.

- A monthly sweep, about ten to fifteen minutes. Look back over the month's projects, decisions, feedback, changes, and problems you helped prevent. Add Quick Captures for anything worth keeping, expand the most significant into a full entry, run the confidentiality check, and tag each item.
- A quarterly review, about thirty minutes. Read the quarter's entries in one sitting, remove duplicates and anything too vague, correct overstatement while you still remember, translate the strongest into Proof Lines, and note where evidence is thin without drawing any conclusion about your career from the gap.

Whether you keep to events, to routines, or to both is yours to settle by what you sustain. The quarterly review, if you use it, is housekeeping. Noticing that you have little evidence of a certain kind of work is a prompt to capture more of it, nothing more.

Retrieving the right evidence

The whole point of tagging is this moment: something is about to happen, and you need the right entries fast. This tells you which kinds of entries to pull for each occasion. It guides retrieval, and the next section, Put Your Record to Work, shows how to carry an entry into a resume line, a LinkedIn About section, an interview answer, and a promotion note. It does not write your resume for you or coach your interviews. It gets you the raw material and a clean first draft. What you do with them is yours.

Performance review: outcomes and prevented problems from the review period, with honest scope. Promotion case: judgment, ownership beyond your title, and work at the next level. Compensation discussion: scope, results, and contributions others have recognized. Internal application: work relevant to the new team, translated out of your current group's language. Resume preparation: your strongest Proof Lines across roles, each honest and portable. Interview preparation: entries with a clear situation, your decision, and the result, ready to tell aloud. Biography or introduction: a few durable, senior-sounding contributions stated plainly. Proposal or portfolio: permitted outcomes that show the kind of work you deliver. Unexpected transition: everything, quickly, because the record is now the only copy you have.

Match your proof to a role

Pick three requirements from one posting. Match each to a Proof Line you have already written. If none fits, write the gap in the third column instead of stretching a line to cover it. A named gap is more credible than a stretched claim.

What the role asks for	My Proof Line that shows it	The gap I will name
<i>Example.</i> Design and run onboarding for a growing team (in the posting's own words).	Redesigned new-hire onboarding for a growing operations team, cutting time to full productivity and reducing early attrition, with the model later adopted by two other departments.	The posting asks for direct management of trainers. I coordinated them without that title, so I will name the scope I carried and not imply the title.

This page translates your evidence for a specific role. It does not advise on which roles to pursue. That is a different question, and a different tool.

Put your record to work

Your record is where the true material lives. This section shows how to carry one Proof Line from that record into the four places people use most. It does not write your resume or coach your interviews. It gives you a clean starting draft in each place, and the words and the choices stay yours.

Before anything leaves the record, run one public-use check. Include only details you are permitted to share publicly. Apply Keep, Care, Never. Leave out employer-confidential names, figures, clients, and systems, and keep any team result separate from your own part. If a detail would fail that check, use the plainer version of it or leave it out.

The four uses below all start from one Proof Line. Maya's runs through each, so you can watch the same material take four shapes. Her Proof Line: "Redesigned new-hire onboarding for a growing operations team, cutting time to full productivity and reducing early attrition, with the model later adopted by two other departments."

A resume line

Purpose: one line that shows the action, the scope, and what changed. Template: what you did, for what scope, what changed, and where it went or who adopted it. Maya: "Redesigned new-hire onboarding for a growing operations team, cutting time to full productivity and reducing early attrition, with the model adopted by two other departments."

A LinkedIn About sentence

Purpose: one first-person sentence a stranger can follow. Template: I do this kind of work for these people, which produces this change. Maya: "I redesign onboarding so new people become productive faster and choose to stay, most recently rebuilding it for a growing operations team and watching the approach spread to two other departments."

An interview answer, in three parts

Purpose: acknowledge the question, prove it with your Proof Line, then name the gap you would still need to learn and how. Template: restate what they asked; give the Proof Line as your evidence; name one thing you have not yet done at their scale, and how you would close it. Maya: "You asked whether I can own onboarding end to end. I redesigned new-hire onboarding for a growing operations team, cut time to full productivity, reduced early attrition, and the model was adopted by two other departments. I have not yet run onboarding at company-wide scale, so I would start by learning the constraints across teams before changing anything."

A promotion or self-review note

Purpose: three to five sentences to a manager covering the situation, your part, what changed, and what you are ready to carry next. Template: the situation and why it mattered; what you specifically did; what changed, with honest scope; what you are ready to take on now. Maya: "Onboarding was slow and new hires were leaving early. I redesigned the flow for our growing operations team, working across the functions that touch a new hire's first weeks. Time to full productivity dropped, early attrition fell, and two other departments adopted the model. I am ready to own onboarding across more of the organization, starting with the teams that have already asked to adopt it."

Keep the record current, and each of these gets easier to write. When the material is already captured, honest, and permitted, every use above becomes a short edit rather than a blank page.

The optional, privacy-conscious AI prompt

Everything in this guide works without any AI. This tool is optional, and it is for one narrow job: helping you translate an entry you have already written into portable language. Before the prompt, the rule that governs it.

Never paste employer names, customer names, colleague names, proprietary detail, employee information, sensitive metrics, code, security information, or any confidential material into an AI system. Give it only your own non-confidential account, already stripped of anything you may not keep. The permission rules in this guide apply to AI tools exactly as they apply to everything else.

The prompt. "You are helping me describe my own work accurately for my private professional record. I will give you only non-confidential information about what I did. Work only with what I provide. If context is missing, ask me for it rather than inventing anything. Never invent numbers, percentages, or results. Preserve my actual level of ownership, keep any team result separate from my individual contribution, and preserve the scope I worked within. Translate internal language into plain, portable language an outsider could understand, and help me refine a single Proof Line. Flag anything that sounds inflated, vague, or unsupported so I can correct it. Do not write a resume, an interview answer, a profile, or anything tailored to a specific job or employer. That is outside this task."

The AI does not decide what is true. You do. Treat every version it returns as a draft to check against your own memory and this guide's rules, never as a finished record.

PART NINE

THE RECORD YOU OWN

The teaching in this guide points at one thing: a record you control and can keep for years. That record is a working document, and it should live where it is easy to search, easy to copy, and entirely yours.

Your Professional Record

Included with this guide is your Professional Record: a copyable working document that holds everything the system produces, in a plain, widely readable format you keep and control. It is the long-term home the handbook has been preparing you to keep. It gathers the capture log, your full entries, your corroboration notes, your Proof Lines, and a simple index, so any entry is a search away.

The Professional Record is deliberately platform-neutral. It does not require any particular app, spreadsheet, or service, and this guide does not recommend one, because the evidence for any single choice is not there. What matters is that it is personally controlled, searchable, easy to duplicate, and kept somewhere your employer does not own. Its full structure, every field and prompt, is laid out in the Professional Record itself.

Fillable and printable pages

If you prefer to write by hand or type into a form, printable and fillable versions of the tools are available as an option. They hold the same fields as the Professional Record. Use whichever you will maintain. The medium does not matter to the discipline; keeping the record current does.

CLOSING

The operating summary

Everything in this guide, on a single page you can return to.

The rule: keep your own account and what you are permitted to retain. Never copy or reconstruct what your employer owns. When unsure, leave it out.

The spine: Capture it while it is fresh. Clarify your part from the team's, and name the judgment and the prevention. Carry it into portable words, kept safely and tagged for later.

The tools: a two-minute Quick Capture for speed, a Full Entry for what matters, general translation into portable language, and a Proof Line as the portable end product.

The rhythm: a focused first session to set up, then keep it current by capturing when something happens, by a light monthly or quarterly sweep, or by both, whichever you will sustain.

The use: pull the right entries for reviews, promotions, compensation, internal moves, resumes, interviews, biographies, proposals, and sudden change.

If you remember only one line: a secure personal device does not make information yours to retain. Permission comes first. Everything else is craft.

The edge of the tool

This guide has a deliberate boundary, and naming it is part of using it well. Keep the Proof builds and translates the record of your work. It does not interpret what that record means for your position, your direction, or your next move. Those are real and important questions. They are simply not this tool's questions.

What this guide answers: what happened and what was my contribution; what decision or judgment I exercised; what changed and what evidence supports it; how I describe it truthfully in portable language; and where and how I keep a permitted record of it.

What it deliberately does not answer: whether my career is stalled or what state it is in; whether this role is still building me, or whether I should stay or leave; what move I should make, or whether a specific destination will value my work. A record can be honest and portable and still meet a market, a committee, or a bias it cannot control. This guide is careful never to suggest that better wording changes those things.

One quiet pointer. If you later want to interpret what your current work is building toward, or read what would travel to a direction you are considering, a separate tool from The Density Group, the Capability Formation Field Kit, is designed for exactly that reading. It is a different job for a different day. This guide's work is done when your record is honest, portable, and safe to keep.

About the author

Temidayo Afonja is the Founder of The Density Group. Her career spans nearly two decades and eight industries, across accounting and audit, cybersecurity, people and workforce work, diversity and inclusion work, and both consulting and operating roles. Across those different contexts, she kept getting close to the same questions: how work gets evaluated, what people are trusted to carry, and how careers get built.

Two parts of that path shaped this guide directly. The years in audit and cybersecurity are why its confidentiality and information–risk standard is treated with real seriousness, and why it is careful never to overstate what any guide can settle for you. The years in people, workforce, and inclusion work are why it takes seriously the kinds of contribution that performance systems tend to miss. Keep the Proof is educational, not legal advice, and it cannot interpret your specific agreements or your employer's policies.

Keep the Proof grew out of a pattern that kept recurring: capable people reaching an important career moment and struggling to reconstruct work they had already done. This guide is the discipline more of them needed.

What you did, the judgment you exercised, and what changed because of it are yours to carry: your own account of your work, kept within the permission rules this guide has held in front of you throughout. That account is clearest while the work is still fresh.

Keep the record while the facts are still yours to keep.
